## Feelings and support among Thai expectant fathers having partner with antenatal depressive symptoms

Nitikorn Phoosuwan<sup>1,2</sup>, Leif Eriksson<sup>1</sup> and Pranee C Lundberg<sup>1</sup>

<sup>1</sup>Uppsala University, Sweden

<sup>2</sup>Kasetsart University, Thailand

**Background:** Over 20% of women worldwide experience antenatal depressive symptoms (ADS). However, what feelings and support expectant fathers have during their partners' pregnancy has rarely been studied, especially in Thailand.

**Objective:** The aim was to explore feelings and support among Thai expectant fathers having a partner with ADS.

Method: This qualitative study was conducted in Sakonnakhon, a north-eastern province in Thailand. Twenty-seven Thai expectant fathers having a pregnant partner (from the 28<sup>th</sup> to the 37<sup>th</sup> gestation week) with ADS (score ≥7 on the Edinburgh Postnatal Depression Scale) participated in the study. A semi-structured interview guide about feelings and support during pregnancy was developed and used during interviews with expectant fathers. The interviews were digitally recorded, transcribed verbatim and subjected to qualitative content analysis.

Results: The participants' age ranged from 17 to 50 years, most were agriculturists/daily-workers (88%), and the majority was low educated (63%). Also, the majority of the participants resided in rural areas (56%) and had lived with their partners for less than five years (59%). Four categories emerged: Fear of changing life, fulfilling a missing piece in life, Enhancing confidence, and Dissatisfaction with assistance. Some participants felt that having a child was an economic burden, while others were satisfied with the

life transition and changed their behavior, for example by refraining from alcohol consumption. The participants were encouraged and supported by peers and their social network. For example, they received financial support from the local government. The expectant fathers needed more information about maternal and child health from healthcare providers, and more involvement in the family.

Conclusion: Healthcare providers should consider the feelings and support of expectant fathers when having a partner with ADS and provide relevant information to them. Expectant fathers need better support from their partners' family.
