Should we follow scientific rules while doing cosmetic intervention?

Mohamed R. Hassan*¹, Ali Nizar Alshamary²

¹Plastic and Reconstructive Surgery, Baghdad, IRAQ

²Pediatric Plastic Surgeon, Baghdad, IRAQ

In the modern era of high demand for cosmetic intervention; whether surgical or non-surgical; we are frequently facing a clients who came with an extreme ideas for cosmetic intervention (nonrealistic but can be done), and here is the delihma? To give them what they want, or be reluctant and stick to the textbook rules.

We always try to moderate the ideas, and always be flexible, as a client with fixed and sound request is always a good candidate to have than others without any clues, who stays in the grey zone. This applies to most of the intervention that we are dealing with from lip augmenations, to temporal brow lift, extreme rhinoplasty, skin and bone liposuctions. Textbooks always explain scientific application of interventions with modest changes to follow the norms, sometimes without considerations to the odds of patient desires and wills, while a client with a solid idea must be respected In doing any extreme intervention, the client should be

thoroughly explained the pros and cons, to get ths big idea from doing as such, and always should keep a failsafe plan if anything goes the wrong way, or to plan a staged approach if the goals cannot be met soon at once.

Biography
